

Tables of Common Transform Pairs

2012 by Marc Ph. Stoecklin — marc@stoecklin.net — <http://www.stoecklin.net/> — 2012-12-20 — version v1.5.3

Engineers and students in communications and mathematics are confronted with transformations such as the z-Transform, the Fourier transform, or the Laplace transform. Often it is quite hard to quickly find the appropriate transform in a book or the Internet, much less to have a comprehensive overview of transformation pairs and corresponding properties.

In this document I compiled a handy collection of the most common transform pairs and properties of the

- ▷ **continuous-time frequency Fourier transform** ($2\pi f$),
- ▷ **continuous-time pulsation Fourier transform** (ω),
- ▷ **z-Transform**,
- ▷ **discrete-time Fourier transform DTFT**, and
- ▷ **Laplace transform**.

Please note that, before including a transformation pair in the table, I verified its correctness. Nevertheless, it is still possible that you may find errors or typos. I am very grateful to everyone dropping me a line and pointing out any concerns or typos.

Notation, Conventions, and Useful Formulas

Imaginary unit	$j^2 = -1$
Complex conjugate	$z = a + jb \quad \longleftrightarrow \quad z^* = a - jb$
Real part	$\Re\{f(t)\} = \frac{1}{2} [f(t) + f^*(t)]$
Imaginary part	$\Im\{f(t)\} = \frac{1}{2j} [f(t) - f^*(t)]$
Dirac delta/Unit impulse	$\delta[n] = \begin{cases} 1, & n = 0 \\ 0, & n \neq 0 \end{cases}$
Heaviside step/Unit step	$u[n] = \begin{cases} 1, & n \geq 0 \\ 0, & n < 0 \end{cases}$
Sine/Cosine	$\sin(x) = \frac{e^{jx} - e^{-jx}}{2j} \quad \cos(x) = \frac{e^{jx} + e^{-jx}}{2}$
Sinc function	$\text{sinc}(x) \equiv \frac{\sin(x)}{x} \quad (\text{unnormalized})$
Rectangular function	$\text{rect}\left(\frac{t}{T}\right) = \begin{cases} 1 & \text{if } t \leq \frac{T}{2} \\ 0 & \text{if } t > \frac{T}{2} \end{cases}$
Triangular function	$\text{triang}\left(\frac{t}{T}\right) = \text{rect}\left(\frac{t}{T}\right) * \text{rect}\left(\frac{t}{T}\right) = \begin{cases} 1 - \frac{ t }{T} & t \leq T \\ 0 & t > T \end{cases}$
Convolution	continuous-time: $(f * g)(t) = \int_{-\infty}^{+\infty} f(\tau) g^*(t - \tau) d\tau$ discrete-time: $(u * v)[n] = \sum_{m=-\infty}^{\infty} u[m] v^*[n - m]$
Parseval theorem	general statement: $\int_{-\infty}^{+\infty} f(t) g^*(t) dt = \int_{-\infty}^{+\infty} F(f) G^*(f) df$ continuous-time: $\int_{-\infty}^{+\infty} f(t) ^2 dt = \int_{-\infty}^{+\infty} F(f) ^2 df$ discrete-time: $\sum_{n=-\infty}^{+\infty} x[n] ^2 = \frac{1}{2\pi} \int_{-\pi}^{+\pi} X(e^{j\omega}) ^2 d\omega$
Geometric series	$\sum_{k=0}^{\infty} x^k = \frac{1}{1-x} \quad \sum_{k=0}^n x^k = \frac{1-x^{n+1}}{1-x}$ in general: $\sum_{k=m}^n x^k = \frac{x^m - x^{n+1}}{1-x}$
