About Techniscan PhL 11.26.20

The main guy there was **Steve Johnson** and he knew **Jim Ball**.
He was making a machine to do **breast** scans for cancer.
I was talking to him in **2007**, 13 years ago.
I talked to them with the idea of getting an **RDT contract** going, but after several meetings it became clear that this was not going to fly. Steve had to give up control of the company to other people and those people did not want my services. I think Steve liked me but the others less so. They didn't have cash to throw around on an expensive contractor!

I recall that the scanner was connected to a massive piece of hardware not shown below

Based out of Salt Lake City, Utah, TechniScan, Inc., is a medical device company. The company is involved in the development of an automated repeatable and safe ultrasound breast imaging and diagnostic system. SVARA is the name given to the system. The system uses the process called Warm Bath Ultrasound wherein the patient is required to lie flat on the diagnostic table facing it. The breast is suspended in a warm water bath with the temperature maintained at skin level. The operator independent system is controlled by software which runs the ultrasound array in a continuous scan that collects a series of successive 3D breast images. The resultant images can be viewed on a DICOM review station.

Here is what the company looked like at 1300 and 3300S on Highland. I don't remember the building.
